

Heat from Waste at DW Mouldings Ltd

Long before it was popular to do so, DW Mouldings have been burning their waste sawdust and chippings to produce heat for their 3084m² factory. With the inclusion of a finishing line in 1999, the heat from the boiler was also used to dry their finished products.

Managing Director 'David Howard' said, 'We have never liked the idea of sending our sawdust to landfill and are always looking at ways to use the waste to our advantage. By using our waste in this way we reduce the need to use other fossil fuels'.
